ANOTHER" filed April 9, 2004; which are all hereby incorporated by reference. All patent applications mentioned in this specification are hereby incorporated by reference in their entirety.

[031] In many cases, novel RGBW panels (and 5-, 6-, n- color panels, for that matter) will be called upon to render legacy RGB or other 3-color image data. In many applications incorporated by reference above, there are described various embodiments for subpixel rendering resampling a modified conventional image data set. The modification is that each and every incoming conventional pixel has four (or more) -- instead of three -- color component values; e.g. Red, Green, Blue, and "White". The "White" in quotes denotes that this color point may or may not be at the white point of the display when all color subpixels are set to their maximum values. It may be desirable that any Gamut Mapping Algorithm (GMA) conversion from RGB to RGBW (or other multiprimary color space) occur before the subpixel rendering to keep the image from being blurred. The filter set could be designed to produce good results for both text and photographs. For example, in the '094 '724 application incorporated by reference, there is shown some novel RGBW and RGBC layouts. For these layouts, one embodiment of the filters for the SPR for layouts that have a red/green checkerboard such as shown in:

DOG Wavelet + Area Resample = Cross-Color Sharpening Kernel

[073] Using a point near the exact center of the sub-pixel as the resample point, in some cases, may be simplified by changing the edge assumptions. A simplifying assumption of placing a target layout (such as shown in the '353 '225 application and other applications incorporated herein) on top of 4 source pixels may result in diamonds and boxes that may be out-of-phase with the input pixels. One example is seen in Figures 13A, 13B, and 13C – depicting the red, green and blue resample areas respectively. Translating all the resample points together is not a simplification since the choice of edge alignment could be arbitrary. In many of the layouts, a slight shift to the left of all the resample points resulted in much simpler filters and sharper greens. For example, such suitable shifts result in the resampling areas seen in Figures 14A, 14B, and 14C.
